Claims 1, 2, 4 and 6

None of the documents cited in the ISR describes the self-attitude estimating device for a leg type moving robot, in which a new drift correction value is decided such that the deviation between the angular attitude speed obtained by correcting the detected value of an angular attitude speed detecting means using a drift correction value and the estimated angular attitude speed of a slip-less angular attitude speed estimating means becomes close to 0. This constitution is not considered to be obvious to a person skilled in the art either.

Claims 3 and 5

None of the documents cited in the ISR describes the self-attitude estimating device for a leg type moving robot, in which the attitude angle of a predetermined region is estimated by integrating the angular attitude speed obtained by correcting at least the detected value of an angular attitude speed detecting means using a drift correction value during the motion of the robot. This constitution is not considered to be obvious to a person skilled in the art either.
